2.3 List of Jumpers

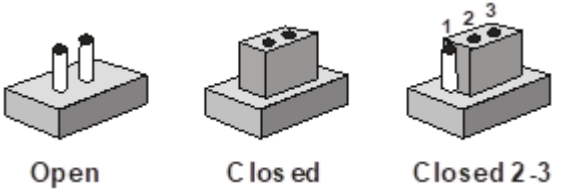
Please refer to the table below for all of the system's jumpers that you can configure for your application.

Label	Function
JP19	Auto-Power Button Selection (AT/ATX Mode)
JP24	CMOS Control Selection (Clear CMOS)

2.3.1 Setting Jumpers

The BOXER-6839-CFL comes with several jumpers which allow you to configure the system by either setting the jumper to "open" or "closed"; or by selecting certain pins. A closed jumper has two pins connected with a jumper clip, while an open jumper has no pins connected.

For jumpers with multiple pins, this guide uses "pins A-B" to notate which pins should be connected by a jumper clip. For example, "pins 1-2" means you should connect pins 1 and 2, while "pins 2-3" means you should connect pins 2 and 3.



A pair of needle-nose pliers may be helpful when working with jumpers.

If you have any questions about how best to configure the system for your application, contact your AAEON representative or visit our website to talk with our support team.

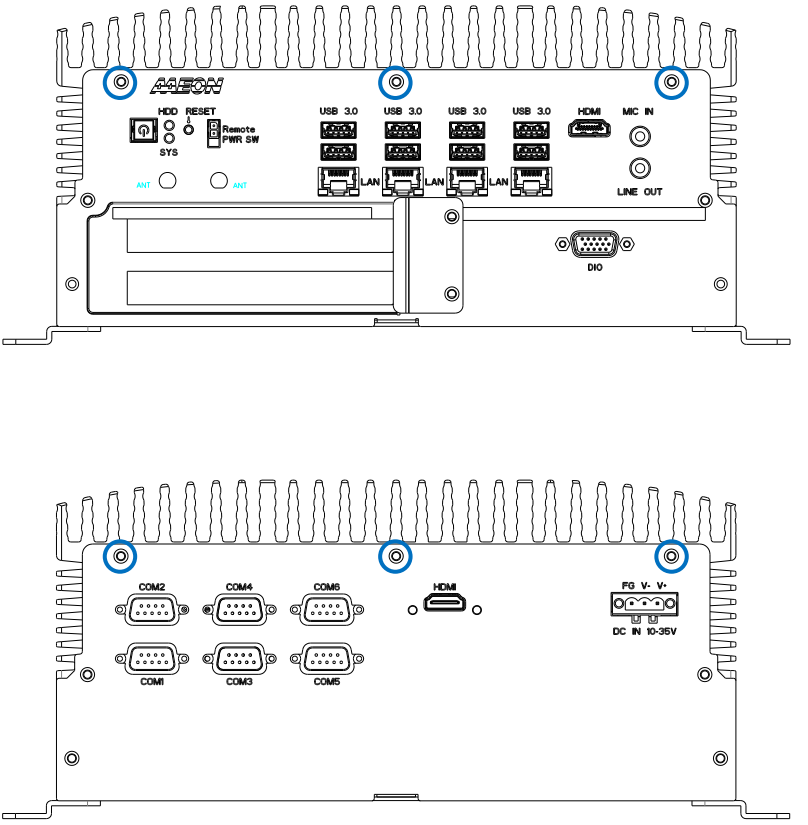
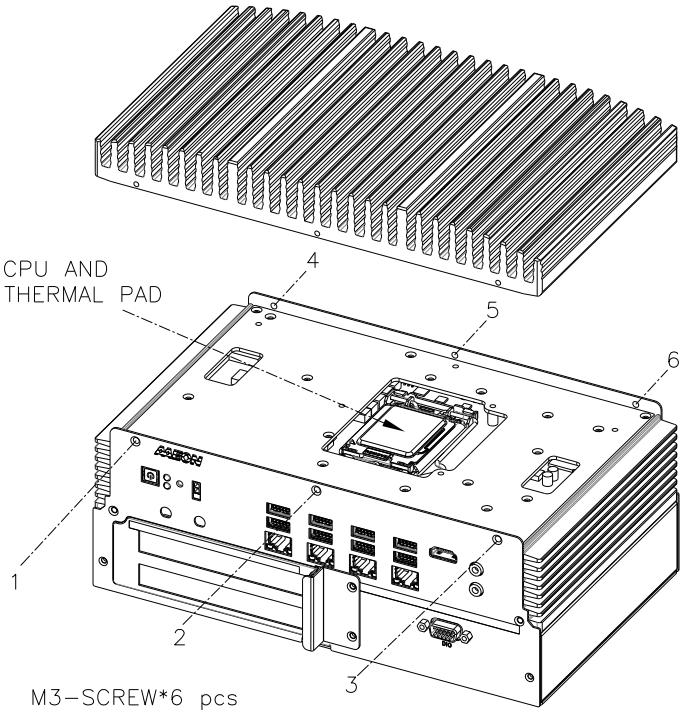
2.5 CPU Installation

Before installing the CPU, ensure the system is powered down and disconnect the power cord from the system. Make sure you have the processor ready to install. See Chapter 1 Specifications for list of compatible CPU/processors.

Step 1: Remove the screws on the front and back of the BOXER-6839-CFL as shown in the figure below (six in total), and remove the top heatsink.



Step 2: Install the CPU into the socket and place the thermal pad on top of the processor.

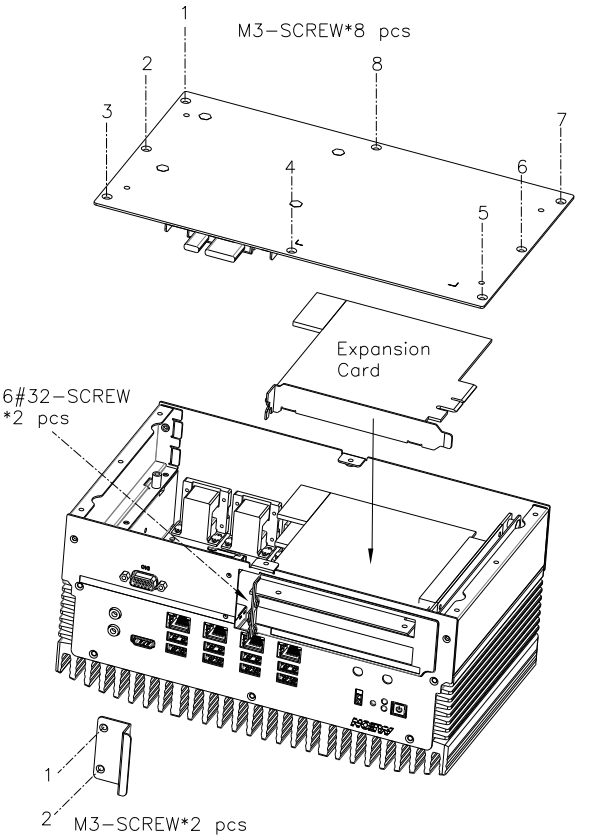


Step 3: Place the heatsink back on and secure with the screws you removed in Step 1.

2.6 Expansion Card Installation

Before installing expansion cards, ensure the system is powered down and disconnect the power cord from the system. Make sure you have the expansion card ready to install. See Chapter 1 for expansion card requirements and specifications.

Step 1: Remove the eight (8) screws from the bottom of the BOXER-6839-CFL. Remove the bottom panel from the system. Also remove the expansion card bracket by removing the two (2) screws holding it in place.



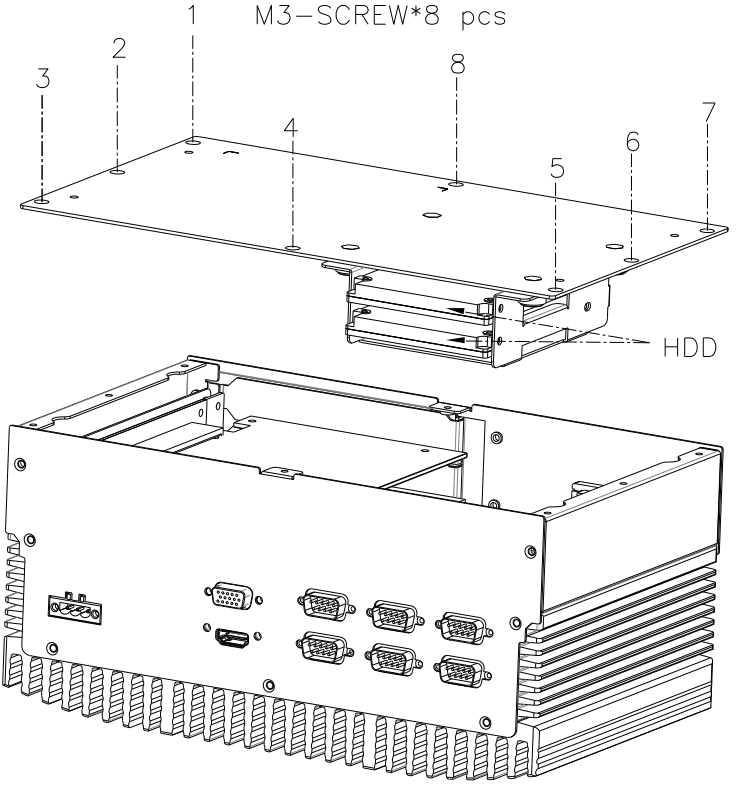
Step 2: Remove the expansion bay cover and install the expansion card. Secure to the chassis with a screw.

Step 3: Reattach the expansion card bracket and secure with the two screws removed in Step 1. Then, replace and secure the bottom panel with the eight screws removed in Step 1. You can skip this step if you also need to install the 2.5" SATA drives.

2.7 2.5″ SATA Drive Installation

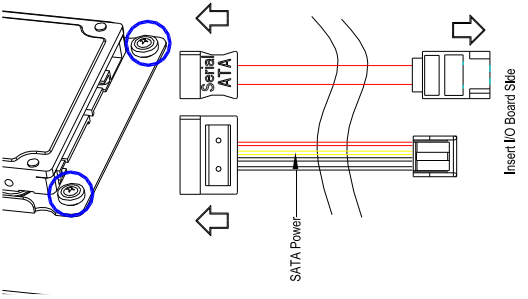
Before installing the 2.5″ SATA drive(s), ensure the system is powered down and disconnect the power cord from the system. Make sure you have the 2.5″ SATA drive(s) ready to install. See Chapter 1 for 2.5″ SATA drive requirements and specifications.

Step 1: Remove the eight (8) screws from the bottom of the BOXER-6839-CFL. Remove the bottom panel from the system.



Step 2: Install the 2.5" SATA drives into the SATA drive mount shown. Secure with four side screws.

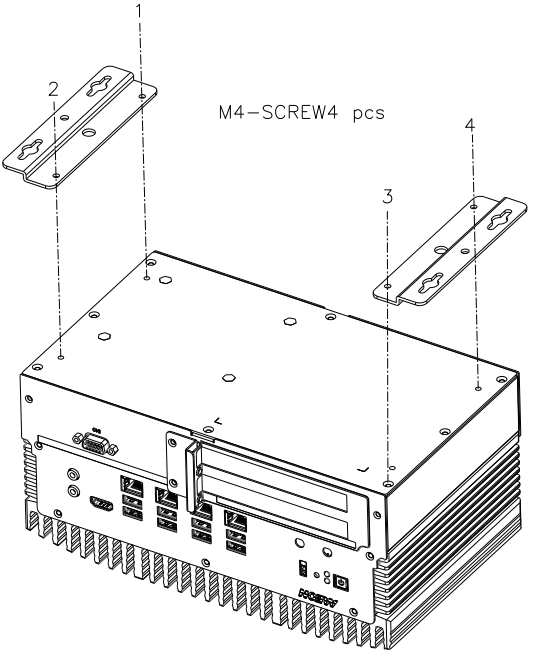
Step 3: Attach the SATA and SATA Power cables to the board and the SATA drive.



Step 4: Replace the bottom panel and secure with the eight (8) screws you removed in Step 1.

2.8 Wallmount Assembly

Step 1: Line up the wallmount brackets in the mounting kit with the holes as shown. The middle hole should line up with the bottom panel screw such that you can easily remove the screw from the bottom panel without having to remove the bracket



Step 2: Use the four screws included with the wallmount kit to secure the wall mount brackets.

Chapter 3

AMI BIOS Setup

3.1 System Test and Initialization

The system uses certain routines to perform testing and initialization during the boot up sequence. If an error, fatal or non-fatal, is encountered, the system will output a few short beeps or an error message. The board can usually continue the boot up sequence with non-fatal errors.

The system configuration verification routines check the current system configuration against the values stored in the CMOS memory. If they do not match, an error message will be output, and the BIOS setup program will need to be run to set the configuration information in memory.

There are three situations in which the CMOS settings will need to be set or changed:

- Starting the system for the first time
- The system hardware has been changed
- The CMOS memory has lost power and the configuration information is erased

The system's CMOS memory uses a backup battery for data retention. The battery must be replaced when it runs down.

3.2 AMI BIOS Setup

The AMI BIOS ROM has a pre-installed Setup program that allows users to modify basic system configurations, which is stored in the battery-backed CMOS RAM and BIOS NVRAM so that the information is retained when the power is turned off.

To enter BIOS Setup, press <Del> or <F2> immediately while your computer is powering up.

The function for each interface can be found below.

Main – Date and time can be set here. Press <Tab> to switch between date elements

Advanced – Enable/ Disable boot option for legacy network devices

Chipset – For hosting bridge parameters

Security – The setup administrator password can be set here

Boot – Enable/ Disable Quiet Boot option

Save & Exit –Save your changes and exit the program

Change User/Administrator Password

You can set an Administrator Password or User Password. An Administrator Password must be set before you can set a User Password. The password will be required during boot up, or when the user enters the Setup utility. A User Password does not provide access to many of the features in the Setup utility.

Select the password you wish to set, and press Enter. In the dialog box, enter your password (must be between 3 and 20 letters or numbers). Press Enter and retype your password to confirm. Press Enter again to set the password.

Removing the Password

Select the password you want to remove and enter the current password. At the next dialog box press Enter to disable password protection.

C.2 DIO Programming

BOXER-6839-CFL utilizes FINTEK F81966 chipset as its Digital I/O controller. The following sections detail the procedures to complete its configuration. The AAEON initial DIO program is also attached to help with developing a customized program for your application.

There are three steps to complete the configuration setup:

Step 1 Enter MB PnP Mode.

Step 2 Modify the data in the configuration registers.

Step 3 Exit MB PnP Mode. Undesired results may occur if MB PnP Mode is not exited properly.

Glue Removal Procedure

D.1 Removing Glue from Your System

To protect components from damage and ensure proper operation out of the box, glue may have been applied to some cables or connectors to keep them in place during shipping. This glue must be removed before attempting to swap components or perform maintenance. This section details the steps needed to remove the glue.

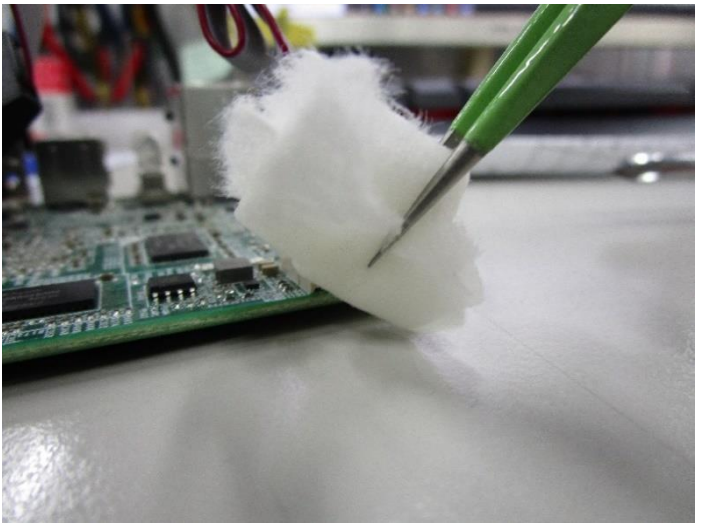
Before performing any kind of system maintenance, ensure the system is shut down (not in sleep or hibernate mode) and the power cable has been removed. Follow steps in Chapter 2 to access the components inside.

You will need the following items for this step:

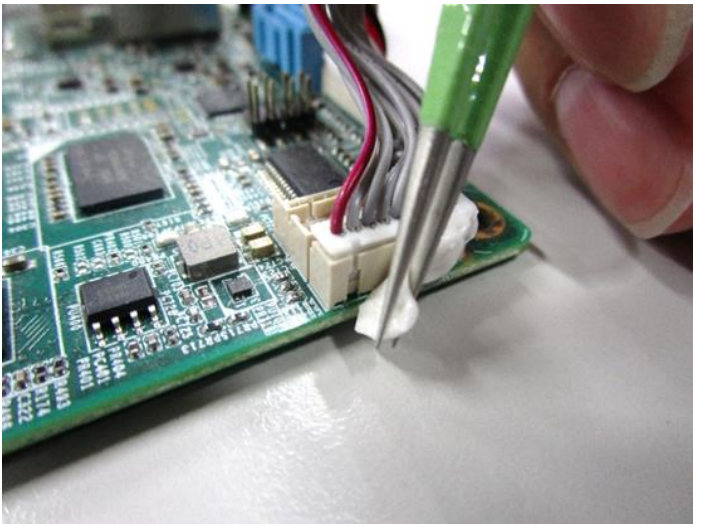
- Cotton or cotton swab
- Anti-static tweezers
- An alcohol solution that is at least 99.5% alcohol (ethanol solution or denatured alcohol). AAEON recommends using an eye dropper or a bottle with a nozzle as in the picture below:

Step 1: Using an eyedropper or bottle as shown above, apply a few drops of alcohol to the glue.

Step 2: Allow the alcohol to soak for 10 seconds, then use a cotton swab or cotton with anti-static tweezers to evenly rub the alcohol over the glue.



Step 3: Let soak for 10 more seconds, then use anti-static tweezers to remove the glue.



If you encounter any issues or need support, please contact your AAEON representative or visit our Support Page at AAEON.com
